

DARK-NET / DRK-JU (DARK 365)

Comprehensive system architecture review, key features, and development roadmap.

1. EXECUTIVE SUMMARY

The **DARK-NET / DRK-JU (DARK 365)** portal is a cyberpunk-themed web application designed as a personal resource hub, software distribution catalog, and utility dashboard. The application blends local client storage with cloud key-value database integration to provide offline fallback capabilities alongside live link indexing.

Core Interface

Vanilla HTML5/CSS3 cyberpunk UI featuring glassmorphism & responsive layouts.

Data Sync

Hybrid storage model using browser LocalStorage and RESTful KV DB APIs.

Media Hub

Filtered resource library with direct popups and category filters.

2. ARCHITECTURE OVERVIEW

3. KEY SYSTEM COMPONENTS

Component	File Target	Functional Description
Link Dashboard	index.html	Real-time searchable link repository with public submission modal and page view analytics.
Media Player	video.html	Category-filtered video catalog with an embedded modal overlay player.
Software Hubs	apple.html, etc.	Platform-specific resource portals categorizing tools for macOS, Windows, and Linux.

4. DETAILED COMPONENT SPECIFICATIONS

A. Real-Time Link Engine:

- Dynamic string search through active link metadata.
- Automatic fallback to browser LocalStorage when cloud API calls fail or timeout.
- Interactive bKash integration modals for system support and user donations.

B. Multi-Category Filtering System:

- Granular filter buttons (e.g., Graphics, OSINT, Research, Utilities, Crack Apps).
- DOM-driven visibility toggling without full page reloads.

5. RECOMMENDED ROADMAP & NEXT STEPS

Priority Focus: Transition from public client-side key-value storage to a protected backend architecture to secure data submission and eliminate potential security vulnerabilities.

Phase	Focus Area	Action Items
Phase 1	Security & Validation	Implement backend sanitization on link submissions to prevent cross-site scripting (XSS).
Phase 2	Backend Storage	Replace kvdb.io with a custom Node.js / Express backend backed by SQLite or PostgreSQL.
Phase 3	Content Management	Build an administrative portal to dynamically add/remove OS application links without editing raw HTML files.
Phase 4	Media Streaming	Integrate dynamic JSON video playlists and adaptive streaming pipelines for video.html.
